(54) Title: DEVICE FOR PROTECTION OF A NEEDLE OF A MEDICAL DEVICE

(57) Abstract: Device for protection of a needle (6) for
a medical device (7), that can enclose the needle (6) in a
first position (13) and leave the needle (6) free in a sec-
ond position (14). The device includes a first part (1)
and a second part (2) which are pivotally connected by a
joint device (12). The first part (1) at a distance from said
joint device (12) includes holding means (5) for retain-
ing the medical device (7) pivotally about an axis that is
essentially parallel with a joint axis of said joint device
(12), so that the two parts (1,2) can be brought together
to the first position (13) for enclosing the needle and can
be separated from each other to the second position (14)
where a retained needle (6) is pivotable to its free posi-
tion (14). The invention also concerns a medical device.
